SENSIT[®] IRED

Quickly determines the presence of ethane in low concentration methane samples.

SENSIT[®] IRED is a state of the art ethane detector incorporating a unique, patented use of infrared absorption spectroscopy to determine the presence of ethane in a methane sample.

This technology can detect as little as 250ppb ethane in a 20ppm methane sample. Even the smallest of samples can be analyzed in the field to determine if gas from a natural gas piping system is being detected.

Ethane is the key “fingerprint” contained in pipeline gas and typically ranges from <2-25% by volume. The SENSIT IRED is a field tool that produces accurate results within minutes rather than hours or days if other methods are used.

Benefits

- Ethane Specific - IRED filters out other gases.
- Ideal for low concentration methane readings.
